

FREED BY FIRE

Some trees rely on fire to spread seeds. Cones that need fire to release seeds are called **serotinous cones**.

Sealed

Open

These cones are normally sealed up tight with a resinous "glue", but fire melts the "glue", allowing the cone to open up and release its seeds.

Can you find a sealed cone?

Can you find an open cone?

Even though some trees need it, fires can be very bad for wildlife and people.

You can prevent accidental fires.

Campfires are the most common cause of wildfires. You can prevent wildfires by making sure your campfire is completely dead.

Which campfire is no longer a danger?
circle your answer

Fire

Embers

Smoke

Answer: None of these. A campfire is only dead when there is no smoke and it is cool enough to touch.
