

# MOON JOURNAL

As the moon orbits Earth, it goes through phases. From a New Moon to a Full Moon and then back again, it takes 29.53 days to complete a full cycle. Observe the moon everyday for a month and shade the circles to show how much of the moon is visible. Write the date, time, and what phase you think the moon's in (New, Waxing, Full, or Waning). If you can't see the moon, make a note on why. You can use the chart below for your first week. Draw the rest on a sheet of paper or make a journal for the moon.
