

## Guiding Pollinators

Many flowers depend on relationships with pollinators to reproduce. A flower's size, shape, color and smell attracts unique pollinators. Yellow flowers attract bees and wasps. Purple flowers tend to attract butterflies, flies and moths.

How many pollinators can you find?

How many types of flowers can you find?

Smell a wildflower.

## Making Connections

We are an intricate part of nature's relationships. Our actions affect everything, from the bees that pollinate our flowers and food crops to the soil we walk on as we hike through the forest. During your hike today, take your time, stop to smell a flower and...

Feel the sun beaming through the trees.

Can you spot trees with storm damage?

## Open... Canopy!

During strong wind storms or cold winter ice storms treetops often crash down to the forest floor. The damaged trees and plants crushed by fallen limbs are affected negatively, but other plants are helped by the holes in the canopy. These holes allow more sunlight to reach understory plants such as wildflowers.

## Caught in the Web of Life

On their daily journeys to find nectar and food, many flying insects get caught in the web of life - the spider's web that is. Different spiders build different types of webs - spiral orb webs, sheet webs, tangle webs, and funnel webs are a few examples.

Can you find a spider on its web?

Can you spot a bird's nest in a tree?

Chuck Summers

Find a lichen growing on a stick or rock.

# Get Connected

## I Lichen You!

A lichen is an organism formed by a relationship between algae and fungus. The fungus protects the algae from adverse conditions, and in exchange the algae provides the fungus with food. This is an example of mutual symbiosis (when two different organisms help each other survive).

(Don't touch!)

How many types of mushrooms can you find?

## A Healthy Home

Forests are home to a variety of plants that require different amounts of nutrients, water and sunlight. Each plant finds its preferred home among the slopes, flat areas and streamsides. Sometimes though, weather events can change the perfect forest home into a mess of stumps and logs.

Can you find a part of the forest that is completely shaded?

Can you find any mycelium?

Can you find a "Turkey Tail" fungi?

## Fungi Feed Forests

Fungi help break down and decompose everything in the forest, from dead trees and fallen logs to leaf litter. Fungi have large, underground networks of "roots" called mycelium that attach themselves to the roots of plants and trees. The plants provide water for the fungi, and the fungi help the plants gather nutrients. Fungi "fruits," or mushrooms, provide food for many insects and animals.

## Connecting Nature's Building Materials

Not only do many bird species eat spiders, some depend on spider webs to build their nests. Many species of hummingbird construct their nests by connecting spider webs and lichens. They use the sticky spider webs to weave materials together and to anchor their nests to the tree's branch. Spotting a hummingbird's nest in a tree is tricky since they're about the size of a golf ball.

## Remember, Everything's Connected

Only a few of the relationships found along the trail were discussed in this brochure. Since everything's connected, many more relationships are present. How many more can you find? Here are some others you can search for:

### Dead Trees: Good?

Dead trees, called snags, can often provide for more life than living trees. This is because many types of insects live inside dead trees, providing a valuable food source for animals such as woodpeckers and bears.

As dead trees decompose, they release nutrients back into the soil for use by future generations of plants and trees, thus completing the cycle.

### Flowers Become Fruit

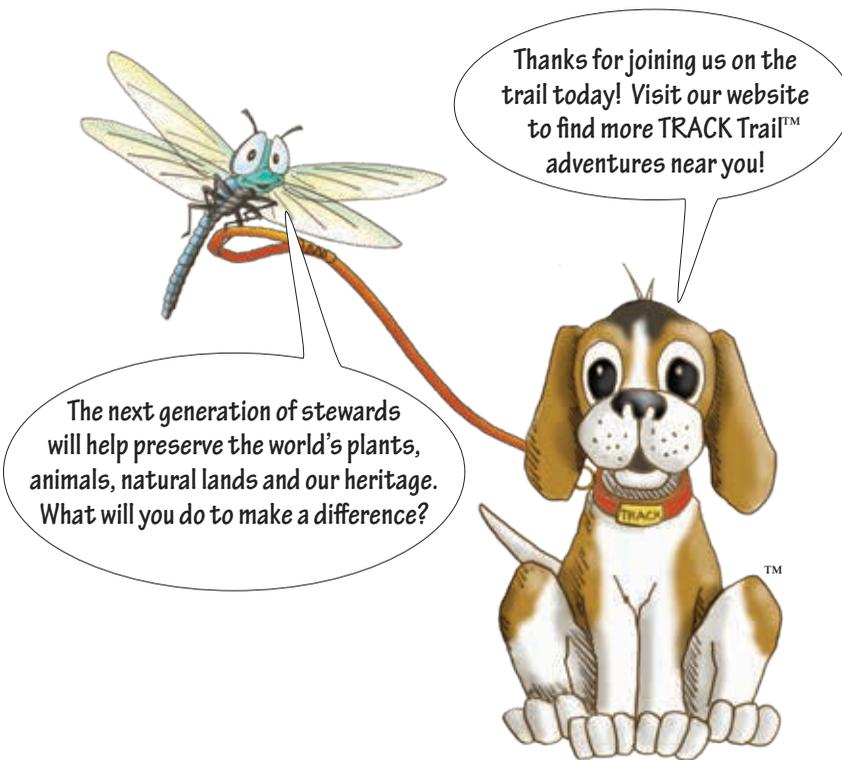

Did you know every flower can become a fruit, and every fruit was once a flower? This is because when a flower is pollinated it transforms into a fruit, in order to produce more seeds. Can you find a plant with fruit on it? If you find a berry, DO NOT eat it. There are many poisonous berries that look a lot like the edible ones.

### People and Nature

We also have a relationship with nature. When you go to the market to buy an apple, remember that the apple was once a flower pollinated by insects. Your home, constructed of wood, rock, or

brick, came from items harvested from nature. Take the time to slow down and experience your natural world. And remember, everything in nature is connected... even us!

# Nature's Relationships: Everything's connected

*"When we try to pick out anything by itself, we find it hitched to everything else in the Universe."  
- John Muir*

Although this brochure will not guide you to specific locations along the trail, it will tell you a story to help you discover some of the relationships found in nature. Use the pictures and text to locate as many of these relationships as you can. Keep your eyes open and have fun!
